I. Objectives

In this section, the goals in this laboratory are:

- To illustrate the process of determining the requirements for a system
- To enumerate both the requirement definition and requirement specification

II. Methods

Manual System

Figure 1. Storyboard of the Manual Salon Management System

In the manual system, customers either walk in or contact the salon through phone calls or messages to inquire about available services and appointment schedules. Salon staff manually check a paper-based logbook to verify available time slots and stylist availability. Once an appointment is agreed upon, the details are written in the logbook. Customer preferences and visit history are either remembered by staff or written informally, which may lead to missing or inconsistent records. This process is time-consuming and prone to scheduling conflicts, lost information, and missed appointments

Automated System

Figure 2. Storyboard of the AutomatedSalon Management System

In the automated system, customers access the salon’s official website using a web browser. From the homepage, customers can view available services, stylists, and pricing. The customer selects a preferred service, stylist, and available date and time through the online booking interface. Once confirmed, the system automatically records the appointment in the database and stores customer information for future reference. The system also provides confirmation notifications, reducing the chances of missed or overlapping appointments. Salon staff can view and manage appointments digitally through the system.

III. Results

The storyboard comparison between the manual and automated systems highlights significant improvements in efficiency, accuracy, and data management.

Process Comparison

Aspect	Manual System	Automated System
Appointment Booking	Phone calls or walk-ins	Online booking via website
Schedule Tracking	Paper logbook	Real-time digital database
Customer Records	Informal or handwritten notes	Centralized CRM storage
Error Risk	High (overlaps, missed entries)	Low (system validation)
Retrieval of Records	Slow and manual	Fast and searchable

The automated system reduces the number of steps required to book and manage appointments while minimizing human error. Through the storyboard analysis, user needs such as faster booking, accurate scheduling, and reliable customer data storage were identified.

Identified Requirements

Requirement Definition:

- The system must allow customers to book appointments online.
- The system must store and manage customer information digitally.
- The system must display stylist availability in real time.
- The system must allow salon staff to view and manage appointments.

Requirement Specification:

- The system shall provide a web-based appointment booking interface accessible through standard browsers.
- The system shall store appointment and customer data in a centralized MySQL database.
- The system shall update stylist schedules automatically upon booking confirmation.
- The system shall generate booking confirmations to reduce no-show occurrences.

The identified requirements directly address the problems observed in the manual system, particularly scheduling conflicts and poor record management.

IV. Conclusion

This laboratory activity demonstrated how system requirements can be effectively determined by analyzing existing manual salon operations and visualizing them through storyboards. By comparing the manual and automated systems, key inefficiencies were identified and translated into clear requirement definitions and specifications. The proposed Web-Based Salon Management and Booking System offers improved scheduling accuracy, better customer data management, and enhanced operational efficiency. Overall, this laboratory highlights the importance of proper requirements determination as a foundation for successful system design and development.
